Project | Sustainability Impact Analysis for Intel

Part 1: Organizing and Understanding the Data

1	How many columns take on numeric values?	6
2	How many columns take on text values?	3
3	Calculate the age of each device by subtracting the **model_year** from 2024. Enter your formula in the **device_age** column and double check that the values make sense. For example, a 2019 device should be 5	
4	Sort the data by **model_year** (oldest to newest). Do you notice more older (5+ years) or newer (under 5 years) devices being repurposed? What might that indicate?	

More devices that are under 5 years old are being repurposed/recycled. This indicates people tend to keep their devices for less than 5 years before deciding to dispose of/stop using them.

I completed these steps, but the boxes did not turn green. I couldn't figure out why.

Part 2: Key Insights

1	What is the total number of devices Intel repurposed in 2024? Note: the data table is named **impact_data**.	19719	Hint!
2	Using the AVERAGE() function, what is the average age of repurposed devices in 2024?	3.9	
3	What is the average estimated energy savings (kWh) from repurposed devices per year compared to new devices?	28.4	
4	What is the total CO2 emissions saved (in tons) from repurposed devices?	276.2	Hint!
5	Now that you have calculated the average estimated energy savings (kWh) and CO2 emissions saved (tons), use ChatGPT to help put these numbers into perspective. Summarize how much energy and CO2 emissions were saved and how it compares to something familiar, like powering households or reducing car emissions.		

Try This Prompt: I found that each repurposed device saves approximately of XXX kWh of energy per year and Intel's repurposing program saved XXX tons of CO2 emissions in one year. Help me understand the significance of these numbers. How would this compare to the energy consumption of a small city or the amount of CO2 produced by cars? What is the environmental impact of these savings?

28.4 kWh is about the same as running a modern refrigerator for 2–3 days, a laptop for ~3 months of normal use, a 10-watt LED light bulb for ~6 months (lifeft on 24/7). The average U.S. household uses ~10,500 kWh/year, so 10,000 repurposed devices = electricity use of 19 households annually. 276.2 metric tons of CO_2 avoided: 60 cars taken off the road for a year, the annual electricity use of 69 U.S. homes, equivalent of planting and growing ~12,500 trees for a year.

Part 3: Deeper Patterns and Trends

1	Using the COUNTIF() function, how many laptops were repurposed?	16512
2	Using the COUNTIF() function, how many desktops were repurposed?	3207
3	Using the AVERAGEIF() function, what is the average energy savings for repurposing laptops?	28.4
4	Using the AVERAGEIF() function, what is the average energy savings for repurposing desktops?	28.8
5	Fill out the summary table to the right. In the column n_devices, use the COUNTIF() function to count the number of devices with each device_age. In the avg_energy_saved column, use the AVERAGEIF() function to calculate the average energy saved for each device_age.	
6	Looking at the summary table, what do you notice about the relationship between device age and the number of devices repurposed versus the average energy saved?	

Despite fewer devices aged 5+ years being repurposed/recycled, they save the most energy. This indicates that more recent models are more energy efficient.

Summary table for Part 3

device_age	n_devices	avg_energy_saved
1	1003	12.1
2	1962	16.6
3	5683	23.8
4	4630	28.3
5	3595	35.1
6	1706	40.0
7	785	46.6
8	355	52.5

Part 4: Data-Driven Recommendations

1	Based on your analysis of the repurposed devices (including energy savings, CO_2 emissions, and device age), write four key takeaways in succinct sentences that summarize the most important patterns and insights from the data. These should be specific, concise, and focused on the implications of repurposing newer versus older devices.	

My takeaways from this data set start with the average age of repurposed devices being 3.9 years. The devices in this age range saw around 23.8-28.3 kWh of energy per device per year on average. Meanwhile, devices aged 5-8 years saw 35.1-52.5 kWh of energy per device per year on average. Devices in the range of 1-2 years of age saw 12.1-16.6 kWh of energy per device per year on average. Based on this data, we can infer that people tend to stop using/upgrade their tech around the 4-year mark, which indicates that there are likely many households with unused devices in the 4-8 year range that could be repurposed at the increased rate of energy conservation in comparison to newer devices.

2	Based on your four key takeaways and ChatGPT as your teammate, write a recommendation for Intel on how to improve the repurposing program. Your recommendation should include a clear action or strategy for Intel based on the data and a data-driven justification for why this approach would maximize energy savings and CO_2 reductions.	

Intel could improve its device repurposing program and increase energy savings by shifting focus to collecting devices aged 4-8 years old. While repurposing any device is great, repurposing older devices contributes to energy savings at nearly double or triple the rate of newer devices, even when this age range receives the fewest donations. Intel's device repurposing data not only indicated the aforementioned statistics, but also that devices are commonly discarded for repurposing near their 4th year of age. This indicates that there are likely plenty of households with unused devices in our target age range. To encourage consumers to repurpose their devices, Intel could begin by creating educational campaigns that point out the benefits of repurposing older devices, which also works to increase its reputation as an environmental leader. To take this one step further, Intel could offer a "trade-in" service that offers a credit or discount when an individual trades in a device aged 4+ years.

3	Briefly reflect on how ChatGPT's suggestions influenced your recommendation. Did it help you see something you hadn't considered? What parts of your recommendation were improved based on its	

ChatGPT enhanced my recommendation to Intel by taking the data I had analyzed and helping me create a strategy. I knew what I wanted to communicate, but I needed help coming up with the best way to translate it into actions. ChatGPT came up with several scenarios of actions Intel could take to target the repurposing of 4-8-year-old devices, which is how I landed on the idea of a "trade-in" service, in addition to increased public education.
